This book is a work of reference which provides an easily understandable survey of all the areas, fields and installations on the Norwegian continental shelf. It also describes developments in these waters since the 1960s, including why Norway was able to become an oil nation, the role of government and the rapid technological progress made.

In addition, the book serves as an industrial heritage plan for the oil and gas industry. This provides the basis for prioritising offshore installations worth designating as national monuments and which should be documented. The book will help to raise awareness of the oil industry as industrial heritage and the management of these assets.
## Platforms by type

### Steel platforms

Integrated = production, drilling and quarters (PDQ)
